

Personalized Knowledge Management

Traditional knowledge management systems are increasingly seen as inflexible and too formal by contemporary knowledge workers. These predominantly document-centric systems have addressed only a fraction of the whole knowledge cycle. Limitations stem from lack of capabilities to manage tacit knowledge; engage users in continuous, active, and dynamic knowledge networking; and to support the exact needs of each user by understanding his or her interests and motivation.

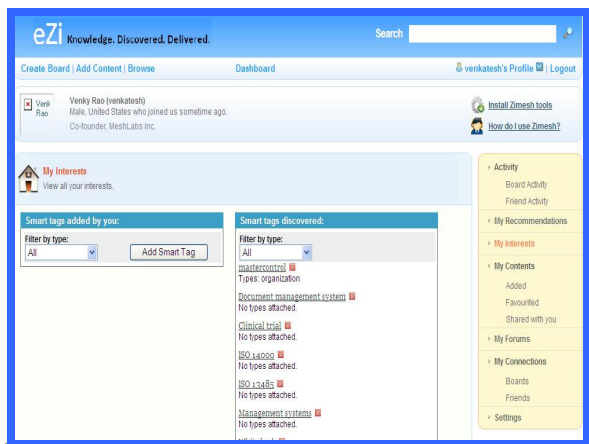

MeshLabs' eZi PKM™ offers a sophisticated, multi-dimensional, user-centric approach to knowledge management. The goal is to directly support the user's work process through intelligent knowledge discovery, personalized recommendations, and richer delivery mechanisms.

Benefits:

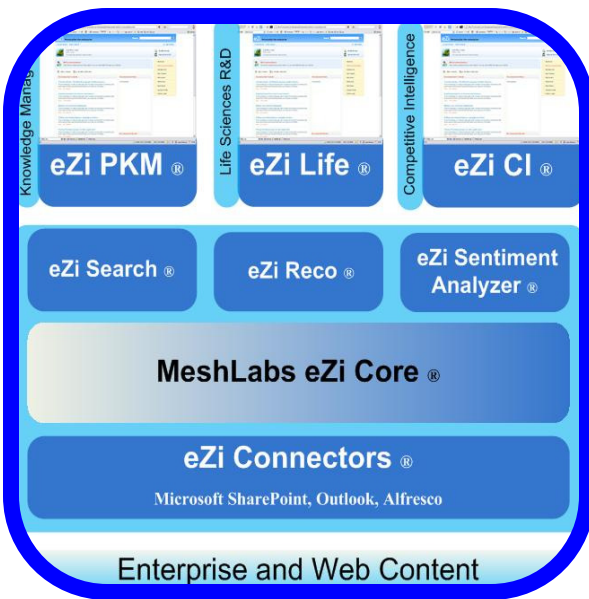

- **Personalized and user-centric approach to knowledge management**
- **Helps create an environment in which knowledge can be created, discovered, captured, shared, distilled, validated, adopted, adapted, delivered, and applied**
- **Stimulate an active, continuous, and dynamic exchange of knowledge**
- **Increase individual and team productivity and quality of work**
